The Basics of Division

Division is a fundamental arithmetic operation that involves splitting a number into equal parts or groups. It is the inverse operation of multiplication and is used to solve problems related to sharing, repeated subtraction, and finding unknown quantities.

When performing division, there are three key components:

- Dividend: The number being divided
- Divisor: The number by which the dividend is being divided
- Quotient: The result or answer of the division

For example, if we have 12 apples and want to share them equally among 3 friends, we divide 12 by 3. The dividend is 12, the divisor is 3, and the quotient is 4, meaning each friend will receive 4 apples.
