This book delves into the nature of gravity through the action of the fields and their orbits around their sources. Gravity fields are curved through this orbit, causing energy to accelerate inward. This acceleration mimics a force of attraction; however, at every point in the field, there is an equal force pushing outward, balancing every orbit. This book discusses the gravity fields of the sun, the planets and their moons to show that the same gravitational acceleration that acts inward also reacts outward, and powers the orbits of all the bodies in the universe.
